

VALVE INSPECTION

in hazardous areas

The Problem

Leaking valves in industry can lead to:

- Losses (energy, steam, pressurized air, scrap, product)
- Risk of injury
- Contamination

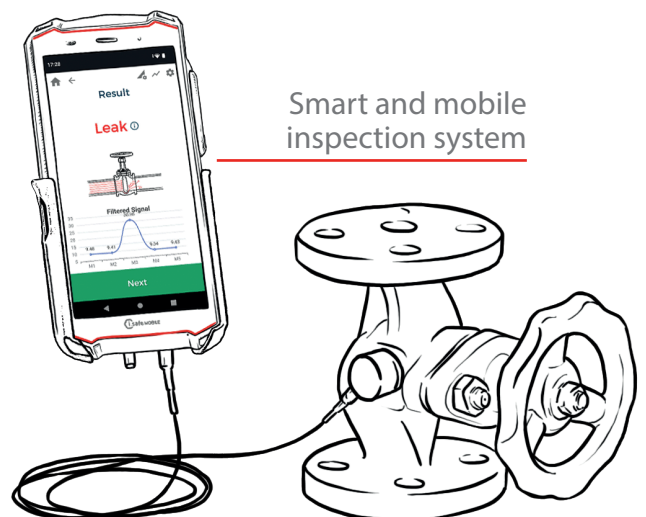

Currently valves are mostly removed and tested on a test bench →

This is time consuming and causes downtime

Valves are therefore rarely inspected and leaks remain unnoticed for a long time

Our Solution

- A smart and mobile inspection system for leak detection in valves
- Valve inspection while process is in operation
- Automated results immediately on site
- All inspection data structurally stored in a platform

Improve efficiency and save time & costs
